## Battery-risk triage

| Signal                        | Risk level | Required action                                                 |
|-------------------------------|------------|-----------------------------------------------------------------|
| Raised trackpad or back cover | High       | Stop use and charging; isolate device                           |
| Smoke or hissing              | Critical   | Move away if safe; contact emergency services where appropriate |
| Chemical odor or unusual heat | High       | Disconnect power if safe; escalate                              |
| Normal warmth during charging | Low        | Continue diagnostic workflow                                    |

## Shipping restriction

SAFETY S-2. A device with suspected battery swelling must not be compressed, punctured, opened, or sent through the standard mail-return workflow. Route the case to a center qualified for battery handling.

## Evidence language

Describe observable conditions such as 'trackpad appears raised' or 'rear cover separation is visible.' Do not claim a definitive battery diagnosis from a photograph alone.

## Human approval

Safety escalations are consequential actions and require a human reviewer. An agent may recommend escalation but cannot downgrade or close it.
